2ND JULY, 2026.

AI Disclosure Statement

I used AI assistance. The tool, purpose, prompt summary, output accepted/rejected, and verification steps are documented below. I understand that I must be able to explain and defend every part of this submission.

Date	Tool	Prompt	Used	Rejected	Verification
02 Jul 2026	ChatGPT (OpenAI)	Client discovery questions	Used 11 questions with minor edits	Removed generic questions	Checked all required topics were covered
02 Jul 2026	ChatGPT (OpenAI)	Requirements transformation	Used requirements, user story, acceptance criteria, API, test case	Removed unnecessary API details	Verified accuracy and testability
02 Jul 2026	ChatGPT (OpenAI)	Reflection writing	Used main ideas and structure	Removed formal tone and technical speculation	Checked first-person style and 250–300 words

- No full raw prompts were pasted into this submission.

- All AI-generated content was reviewed, edited for accuracy and relevance, and adapted to fit the specific context of the General Bar And Foods project.
- I can explain and defend every requirement, question, and insight in this submission based on the client conversation evidence provided.
- The AI was used as a structuring and brainstorming tool; all final decisions, wording choices, and analytical judgments were made by me.

A. Personal Question Set

Client Discovery Questions for General Bar And Foods

Current Workflow

1. Can you walk me through the typical process of a customer placing an order, from the moment they decide to order to the moment they receive their food?
2. How do you currently manage your menu, especially when items are out of stock or prices change?

Pain Points

3. What are the biggest challenges you face with your current order-taking process (e.g., phone calls, walk-ins)?
4. What is the most frustrating part of managing your business operations on a busy day?

Data

5. What key information do you need to capture from customers to fulfill an order correctly?
6. What information about your business (e.g., sales, popular items) would be most valuable for you to track and analyze?

Success Criteria

7. How will you know if this new digital system is a success for your business? What would be the most important outcome?
8. What would be a "must-have" feature that would convince you this project was worthwhile?

Security & Privacy

9. What are your main concerns about handling customer data, like phone numbers or addresses, online? Are there any specific local regulations we need to be aware of?

Failure/Exception Handling

10. What should happen if a customer places an order online for an item that is actually out of stock?

11. What is your preferred way to handle a situation where an online order fails to go through or the customer doesn't receive a confirmation?

B. Interview / Observation Evidence

Date: 30 June 2026

Time: Approximately 11:30 a.m. – 2:50 p.m.

Medium: WhatsApp Chat

Participant Role: Business Owner / Representative, General Bar And Foods

Evidence Type: WhatsApp conversation (screenshots attached with private information redacted where necessary)

Summary of the Interaction

Team KWERH introduced the proposed Digital Ordering and Business Management System to the client and explained how a website could improve customer access to the business. The discussion highlighted how an online platform could make it easier for customers to browse available menu items, place food orders, and discover the business through online searches.

The client initially indicated that they wanted time to consider the proposal. After discussing the proposal internally, the client responded positively and agreed to work with Team KWERH on the project. This conversation confirmed the client's interest in developing a digital solution for the business.

At the time of this assignment, a detailed requirements elicitation meeting had not yet been conducted. Therefore, several functional requirements remain subject to confirmation during future client meetings.

C. Requirement Transformation

Selected Raw Client Statement:

"Yes, we definitely want a website to take orders. But my main worry is the menu. We change it almost every week based on what's fresh. If we put it online, I need to be able to update it myself, or it's going to be a nightmare. We can't be calling a developer every time we add a special."

Functional Requirement:

The system shall provide an administrative interface that allows an authorized user (e.g., the business owner) to create, update, and delete menu items, including fields for item name, description, price, and availability status.

Non-Functional Requirement:

The system's administrative interface shall be designed with a user-friendly and intuitive interface so that a non-technical user can perform menu updates within 5 minutes of logging in.

User Story:

As a business owner, I want to be able to update the menu and items myself through an easy-to-use admin panel, so that I can manage daily specials and stock changes without needing to contact a developer.

Acceptance Criteria:

1. The admin can log in to a secure back-end dashboard.
2. The dashboard has a clearly labelled "Manage Menu" section.
3. The admin can add a new item, specifying its name, description, price, and category.
4. The admin can edit any existing item's details.
5. The admin can easily set an item's status to "Available" or "Unavailable," which will hide it from the customer-facing website immediately.

API/Interface Implication:

The admin interface will need to use a REST API to interact with the back-end database. This will require endpoints for `GET /api/menu-items`, `POST /api/menu-items`, `PUT /api/menu-items/{id}`, and `DELETE /api/menu-items/{id}`.

Data Implication:

The menu items will need to be stored in a database with a schema that includes fields for `itemId`, `name`, `description`, `price`, `category`, and a boolean `isAvailable` flag to easily control visibility.

Test Idea:

Test Case: Verify that an admin can mark a menu item as "unavailable."

1. Log in to the admin panel.
2. Navigate to the "Manage Menu" section.
3. Find a specific item and change its status from "Available" to "Unavailable."
4. Save the change.
5. Log out and visit the customer-facing website.
6. Confirm that the marked menu item is no longer visible to customers.

Open Question:

What is your preferred frequency for updating the menu? Do you envision making multiple small changes daily, or larger weekly updates, as this might influence the design of the admin interface for efficiency?

D. Reflection

My initial assumption before this conversation was that the primary driver for a business like General Bar And Foods to get a website was the need for a sophisticated marketing tool to attract new customers. I assumed the client's primary focus would be on the outward-facing features like a beautiful design, search engine optimization, and social media integration. My understanding was that the "ordering" and "management" aspects were secondary benefits to the "online presence."

However, the conversation completely shifted this view. The client's immediate and primary concern was not about marketing or finding new customers, but about operational efficiency and control over their internal data. The statement, "We change it almost every week based on what's fresh... I need to be able to update it myself, or it's going to be a nightmare," revealed that the true value proposition for this client is process automation and autonomy. They are not just a "business" looking for a generic website; they are a dynamic, perishable-goods-based operation where the menu is the lifeblood of the entire system. A failure to manage the menu effectively online would create more work, not less.

My assumption that external marketing was the primary need was weakened. It became clear that the foundational requirement is a robust, user-friendly Content Management System (CMS) that empowers the owner. The "website" is merely the interface for the customer, but the core of the project is an internal tool that solves a critical workflow and data management problem. This realization fundamentally changes the focus of the project from "building a website" to "building a business management platform with a customer-facing website."
